Fabrik Finance — MVP Product Requirements Document

Product: Fabrik Finance
Version: MVP 1.0
Positioning: *Your AI Finance Department*
Primary Market: US SMBs
Initial Service: AI-first bookkeeping
System of Record: QuickBooks Online
Core Principle: AI performs routine bookkeeping; humans review exceptions and sensitive actions.

Demo:
https://claude.ai/design/p/e8bdd7fc-c9ea-4468-909a-b58bfb73e390?file=Fabrik+Finance+Prototype.dc.html&via=share

---

1. Product Vision

Fabrik Finance is an AI-first bookkeeping and finance operations platform combining automation, AI agents and human accountants.

The customer should experience:

> **"My books are continuously maintained. Fabrik only asks me questions when it genuinely needs my input."**

The internal operations team should experience:

> **"I manage exceptions rather than manually processing every transaction."**

The MVP therefore has two applications:

Client Portal — used by business owners / finance users.

Operations Portal — used by Fabrik bookkeeping staff.

QuickBooks remains the authoritative accounting ledger.

---

2. MVP Objectives

The MVP needs to prove four things.

Customer experience

A business owner can connect their books and easily understand:

- cash position
- revenue
- expenses
- P&L
- Balance Sheet
- Cash Flow
- bookkeeping status
- outstanding questions
- financial documents

AI automation

Fabrik can automatically:

- ingest transactions
- classify transactions
- suggest chart-of-account mappings
- identify unusual/uncertain transactions
- extract information from documents
- match documents against transactions
- generate bookkeeping questions
- answer questions about financial information

Human-in-the-loop

Accountants primarily work on exceptions rather than reviewing everything.

Unit economics

Most importantly, we need to measure:

> **Human bookkeeping minutes per customer per month.**

---

3. User Roles

I would initially support five roles.

Role	Purpose
Business Owner	Customer administrator
Client Finance User	Customer employee/accountant
Fabrik Bookkeeper	Processes exceptions
Fabrik Reviewer	Reviews/approves bookkeeping
Fabrik Admin	Customer/user/system administration

RBAC should be implemented from the beginning.

---

4. Client Portal

4.1 Login & Organization

Users can:

- login/logout
- reset password

- use MFA
- select organization
- invite users
- manage basic profile
- see connected integrations

A user may eventually belong to multiple companies, so organization tenancy should exist from V1.

---

5. Dashboard

The dashboard is the customer's financial home screen.

KPI cards

Display:

Cash

Revenue — current month

Expenses — current month

Net Income

Bookkeeping Status

Example:

Cash

$384,210

Revenue

$142,500

↑ 12%

Expenses

$97,800

↑ 4%

Net Income

$44,700

Financial trend

Graph:

Revenue vs Expenses

Options:

1 month / 3 months / 6 months / 12 months

Books status

Example:

SEPTEMBER BOOKS

✓ Transactions processed

✓ Bank reconciliation

✓ Documents reviewed

● Accountant review

○ Monthly close

87% Complete

Attention required

Example:

FABRIK NEEDS YOUR HELP

3 Transactions

2 Missing Documents

1 Question

[Review]

This becomes extremely important to the customer UX.

---

6. Finance Inbox

I would make **Finance Inbox one of Fabrik Finance's defining features**.

Instead of customers navigating accounting screens, Fabrik asks questions.

Inbox item types

Transaction clarification

Missing receipt

Missing invoice

Vendor clarification

Customer clarification

Accountant question

Integration problem

Monthly-close question

Example

We need help categorizing this transaction.

AMZN MKTPLACE

$1,482.20

October 8

Fabrik thinks:

Office Supplies 62%

Marketing 21%

Other 17%

What was this purchase for?

[Office Supplies]

[Marketing]

[Other]

[Add Comment]

The response becomes structured bookkeeping information.

---

7. Transactions

Customer can view all imported transactions.

Columns:

Date	Description	Amount	Account	Category	Status

Filters:

- date
- bank account
- category
- amount
- status
- AI confidence
- vendor

Statuses:

Processed

Needs Review

Waiting for Client

Approved

Excluded

Transaction detail should show:

HOME DEPOT

$481.22

Account

Chase Business ••••1245

Fabrik Category

Repairs & Maintenance

AI Confidence

96%

Supporting Document

receipt_231.pdf

Reason

Similar transactions from Home Depot were

previously categorized as Repairs & Maintenance.

Explainability is useful here.

---

8. AI Transaction Categorization

This is the **core MVP engine**.

For every transaction, Fabrik generates:

- vendor
- normalized vendor
- transaction type
- proposed category
- proposed GL account
- confidence

- explanation
- potential duplicate
- anomaly indicator
- document match

Example:

```
{
  "vendor": "Amazon",
  "transaction_type": "expense",
  "category": "Office Supplies",
  "confidence": 0.97,
  "document_match": true
}
```

Confidence policy

I would **not hard-code 98% as the permanent threshold**.

Make thresholds configurable.

For MVP:

≥98%

Eligible for automatic processing.

85–98%

Bookkeeper review.

<85%

Bookkeeper/client clarification.

But risk rules override confidence.

---

9. Risk Engine

Certain transactions must always receive human review.

Examples:

- loans
- equity
- shareholder transactions
- intercompany transactions
- large transactions
- unusual journal entries
- tax payments
- payroll adjustments
- asset purchases
- refunds
- chargebacks
- unknown vendors

Therefore:

Confidence Score + Risk Score → Processing Decision

This is safer than confidence alone.

---

10. Documents — FabrikIDP

This is where Fabrik Finance can leverage your existing FabrikIDP capability.

Customer can:

- drag/drop documents
- upload PDFs
- upload images
- view processed documents
- associate documents with transactions

Supported MVP documents:

Invoice

Receipt

Bank statement

Credit-card statement

Don't try to support every financial document initially.

Extraction

FabrikIDP extracts:

- vendor
- document number
- document date
- due date
- subtotal
- tax
- total
- currency
- line items where practical

Then Fabrik attempts to match:

Invoice

AWS

$4,282.17

Sep 30

↓

Possible Transaction

AMAZON WEB SERVICES

$4,282.17

Oct 2

Match Confidence: 99%

[Match]

---

11. Reconciliation

Bookkeepers need a reconciliation workspace.

Display:

CHASE BUSINESS ••••1245

Statement Balance $184,220

Book Balance $184,220

Difference $0

Matched 237

Unmatched 3

Duplicates 1

Reconciliation Status

READY FOR REVIEW

AI should assist matching.

Human approves the final reconciliation.

---

12. Reports

MVP reports:

Profit & Loss

Monthly / quarterly / annual.

Balance Sheet

As-of-date reporting.

Cash Flow Statement

Operating / investing / financing.

The data should primarily originate from QuickBooks rather than Fabrik creating its own parallel accounting ledger.

Export:

PDF

Excel

---

13. Ask Fabrik

This becomes the customer-facing AI interface.

Persistent button:

> **Ask Fabrik**

Examples:

> How much did we spend on marketing this year?

Compare revenue with last quarter.

Who are our largest vendors?

Why did expenses increase in September?

How much did we pay AWS this year?

Show travel expenses over $1,000.

What is our current cash position?

Answers should provide both the answer and supporting transactions/report data.

Important MVP restriction

Fabrik is initially **read-only through conversational AI**.

It shouldn't execute:

"Transfer $20,000."

or

"Pay this invoice."

Those capabilities come later.

---

14. Monthly Close

Each customer/month has a close workflow.

Example:

SEPTEMBER 2026

Transactions categorized ✓

Documents processed ✓

Bank reconciliation ✓

Credit card reconciliation ✓

Client questions resolved ✓

Bookkeeper review ✓

Reviewer approval ●

Reports generated ○

Tasks should be generated automatically where possible.

---

15. Monthly Finance Package

Once books are closed, Fabrik generates a monthly package.

Contains:

Executive Summary

P&L

Balance Sheet

Cash Flow

Revenue trend

Expense trend

Major expense changes

Notable transactions

AI-generated observations

Example:

> Revenue increased 12% compared with August.
>
> Operating expenses increased 7%, primarily due to legal expenses.
>
> Payroll remained stable.

Cash increased by $28,400.

This is much more valuable than simply emailing a P&L.

---

16. Operations Portal

This is arguably **the most important part of the MVP**.

Home screen:

FABRIK OPERATIONS

Active Clients 42

Books Closed 31

In Progress 8

At Risk 3

Transactions

AI Processed 8,421

Human Reviewed 782

Client Questions 87

Automation Rate 91.5%

---

17. Client Work Queue

The operations team shouldn't navigate customer-by-customer looking for work.

Fabrik generates a global queue.

Example:

Priority	Client	Task	Age
Critical	Acme	Reconciliation difference	2d
High	LandCo	7 transactions	1d
Medium	FarmCo	Missing statement	3d
Low	ABC	Review transaction	4h

Filters:

Client

Bookkeeper

Task type

Priority

Month

Status

---

18. AI Review Queue

Bookkeeper sees only uncertain transactions.

ACME HOLDINGS

27 ITEMS NEED REVIEW

HOME DEPOT

$481.22

AI Recommendation

Repairs & Maintenance

Confidence

91%

Reason

Vendor historically categorized here

11 of previous 12 transactions.

[APPROVE]

[CHANGE]

[ASK CLIENT]

Bulk approval should be supported.

This screen will determine whether Fabrik Finance's economics work.

---

19. Client Question Workflow

Bookkeeper clicks:

ASK CLIENT

Fabrik generates the question.

Example:

> We found a $1,482 Amazon purchase on October 8. Was this for office supplies, marketing, software or something else?

Customer sees it in Finance Inbox.

Customer answers.

Transaction returns automatically to processing.

No email chains.

---

20. Audit Trail

Every accounting decision should be recorded.

Store:

Original data

AI recommendation

AI model/version

Confidence

Risk classification

Human decision

User

Timestamp

Changes

Example:

Oct 10 09:31

AI suggested:

Office Supplies

Confidence 87%

Oct 10 10:42

Sarah changed:

Software Subscriptions

Oct 10 10:43

Transaction approved.

This will become very important as the platform scales.

---

21. QuickBooks Online Integration

I'd make **QBO the only accounting integration in MVP**.

OAuth connection.

Import:

- chart of accounts
- bank transactions
- customers
- vendors
- invoices
- bills
- journal entries
- reports
- accounts

Where appropriate, Fabrik can write approved categorizations/changes back to QBO.

The integration needs robust:

sync status

retry

error logging

duplicate prevention

idempotency

---

22. Notifications

MVP channels:

In-app

Email

Examples:

Fabrik needs your help with 4 transactions.

September books are ready.

Your QuickBooks connection needs attention.

Avoid sending a notification for every transaction.

Bundle them intelligently.

---

23. Administration

Fabrik Admin can manage:

Customers

Organizations

Users

Roles

Bookkeepers

Reviewer assignment

Plans

AI thresholds

Risk rules

Integrations

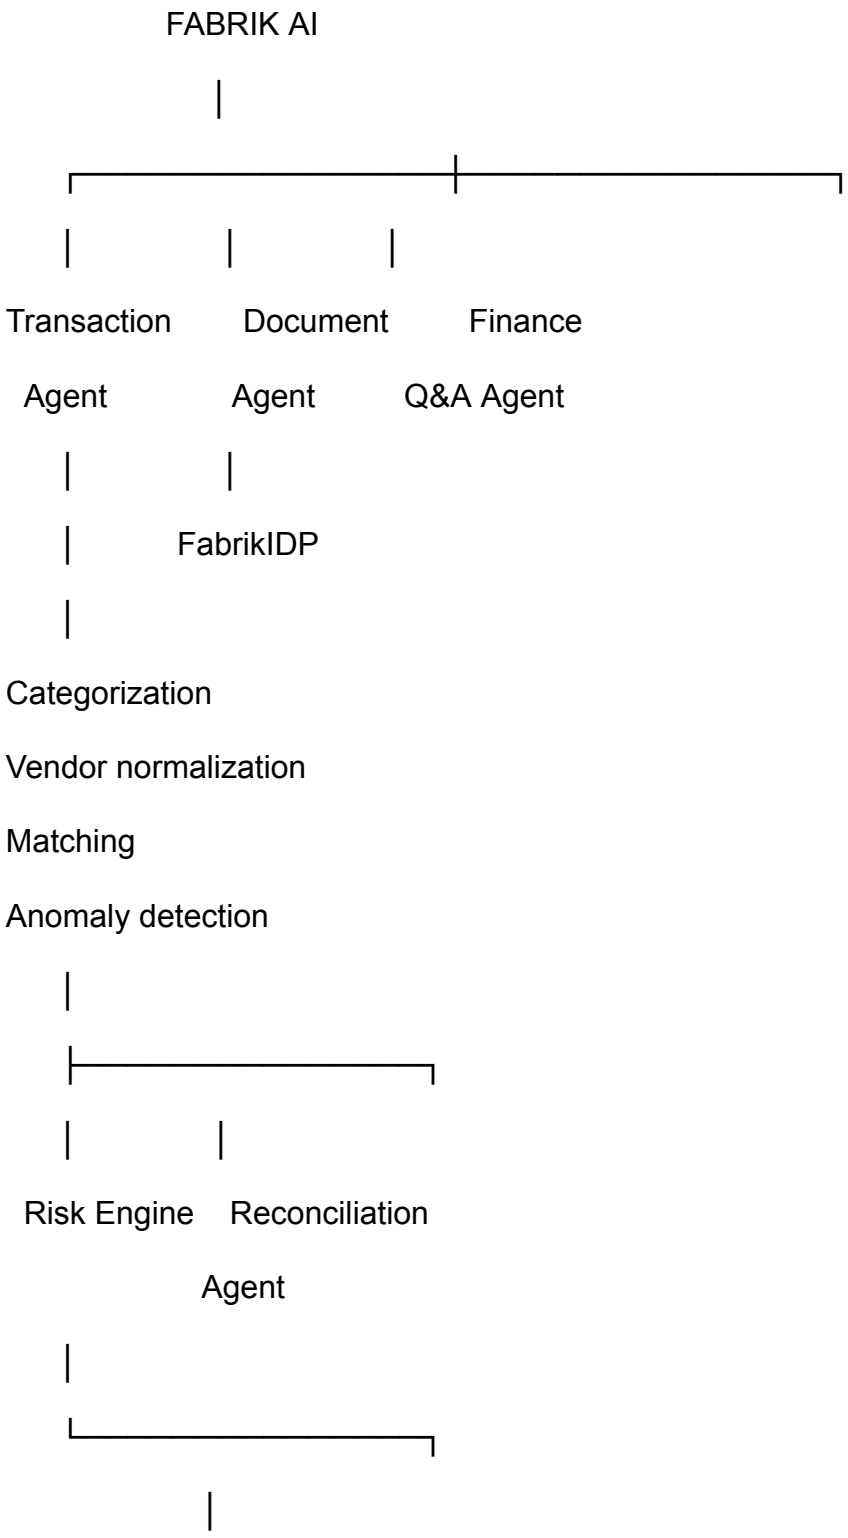

Close schedules

Account status

---

24. AI Architecture

I would architect this as several specialized agents rather than one giant "accounting agent."

Close Agent

Above these should sit an **orchestration/workflow layer**.

---

25. AI Learning / Rules Engine

One subtle but important requirement:

Fabrik needs to learn **organization-specific accounting behavior**.

Suppose the customer corrects:

AWS → Software & Hosting

Fabrik remembers:

Organization: Acme

Vendor: AWS

Default Category: Software & Hosting

Next AWS transaction receives much higher confidence.

Rules should support:

Organization rule

Vendor rule

Amount rule

Description rule

Recurring transaction rule

This can dramatically improve automation after the first few months.

---

26. Non-Functional Requirements

Security

MFA

Encryption at rest

TLS

RBAC

Tenant isolation

Audit logs

Secrets management

Session management

Secure OAuth token storage

Architecture

Multi-tenant SaaS.

Suggested EC stack:

Frontend: React / Next.js

Backend: Python + FastAPI

Database: PostgreSQL

Queue: Redis + worker system

Object storage: S3

AI: model-agnostic LLM gateway

IDP: FabrikIDP

Accounting: QuickBooks API

Authentication: Auth0 / Cognito or equivalent

Infrastructure: AWS

---

27. Critical Metrics

This deserves its own analytics layer.

North Star

Human Minutes per Client per Month

Everything else ultimately supports this.

Also track:

Metric	Initial target
AI transaction automation	>80%
Human-reviewed transactions	<20%
Client clarification	<5%
Document extraction accuracy	>95%
Reconciliation success	>90%
Monthly close	<10 business days

QBO sync success	>99%

And I'd add:

Human Minutes / 100 Transactions

This lets you compare customers of different sizes.

---

28. Explicitly Out of Scope

This is essential to prevent EC's MVP from becoming a six-month project.

NOT V1:

Payroll execution

Tax filing

R&D tax credits

Bill payment

Bank transfers

Corporate cards

Expense cards

Accounts-receivable collection agents

Full AP automation

Budgeting

Advanced forecasting

Fractional CFO

Inventory accounting

Multi-currency accounting

Consolidated companies

1099 filing

W-2 filing

ERP integrations

Xero

NetSuite

Sage

Mobile apps

Native banking

Customer payments

These can all come later.

---

29. Core MVP Screens

I'd estimate roughly **18 primary screens**, with reusable detail/modals rather than treating every interaction as a separate screen.

Customer

1. Login / onboarding
2. Dashboard
3. Finance Inbox
4. Transactions
5. Transaction detail
6. Documents
7. Reports
8. P&L
9. Balance Sheet
10. Cash Flow
11. Monthly Close
12. Monthly Finance Package

13. Ask Fabrik
14. Integrations
15. Team / Settings

Fabrik Operations

16. Operations Dashboard
17. Work Queue
18. AI Review / Client Workspace

Admin, reconciliation and audit capabilities can initially sit within these workspaces rather than becoming elaborate standalone modules.

---

30. Suggested Development Phases

I'd approach it in **four development increments**, but avoid committing the team to dates until the clickable prototype and QBO API spike are done.

Foundation: tenancy, authentication, RBAC, QBO connection, data model, transaction ingestion.

Bookkeeping Engine: categorization, confidence/risk engine, review queue, client questions, rules/learning.

Finance Experience: dashboard, reports, documents/FabrikIDP, Ask Fabrik, Finance Inbox.

Close & Production: reconciliation, monthly close, finance package, audit trail, notifications, operations analytics and production hardening.

The first pilot should be **5–10 US businesses**, ideally businesses whose books you can inspect closely and where transaction patterns aren't extremely complicated.

The key product decision

I would **not measure success by how similar Fabrik Finance looks to Fondo**.

I'd measure it by:

Can Fabrik close the books of a $1–10M US SMB with 80–90% of routine bookkeeping work performed without human intervention?

If the answer becomes yes, you've built something substantially more valuable than a bookkeeping portal.

The portal is the interface.

The actual IP is the AI bookkeeping operating system sitting behind it.

Category	Integrations / systems Fondo references	What Fondo uses it for
Banking	Mercury	Bank transactions, reconciliation
Corporate cards / spend	Brex, Ramp	Expenses, card transactions, monthly close
Payroll	Gusto, Rippling, ADP	Payroll accounting + R&D tax-credit data

Payroll – additional supported systems	QuickBooks, Justworks, Paychex, Namely, TriNet, Sage, OnPay	Payroll data / tax-credit workflows
International payroll / contractors	Deel	Contractor/payroll data
Payments	Stripe	Revenue/payment transactions
Subscriptions	Chargebee	Subscription/revenue data
Accounting / GL	QuickBooks Online, Xero	General ledger/accounting workflow

Fondo explicitly says its payroll support includes **Gusto, Rippling, ADP, QuickBooks, Justworks, Paychex, Namely, TriNet, Sage and OnPay**. Fondo It also describes startup bookkeeping across systems such as **Brex, Mercury, Rippling, Deel, Stripe and Chargebee**. Fondo

More importantly for what you're building with **Fabrik Finance**, Fondo's integration philosophy seems to be:

Bank + Card/Expense + Payroll + Revenue → Accounting/GL → AI/Accountant close

For example:

Mercury → cash transactions
Brex/Ramp → expenses
Gusto/Rippling/ADP → payroll
Stripe → revenue
↓
Fondo
↓
categorization → reconciliation → P&L → Balance Sheet → cash flow → tax → R&D credits

Their recent material specifically describes automated/native data flows for **Gusto + Brex + Ramp** into the monthly-close process, although Fondo itself cautions that the exact connection scope and refresh behavior should be confirmed. ai.fondo.com

What I would do differently for Fabrik Finance

For the MVP PRD we're working on, I wouldn't try to match 20–30 integrations. I'd make **6 connectors** first:

1. **QuickBooks Online** — accounting system / GL
2. **Mercury** — startup banking
3. **Ramp** — cards + expense management
4. **Gusto** — payroll
5. **Stripe** — revenue/payments
6. **Plaid** — long-tail bank connectivity

That gives Fabrik Finance access to most of the information needed to perform an **AI-first monthly close** without building dozens of banking connectors individually.

Then Phase 2 could add **Brex, Rippling, Deel, Bill.com, Xero, Shopify and Chargebee**.

The key architectural decision I'd make is **not to build Fabrik Finance as another accounting ledger initially**. Make **QuickBooks/Xero the ledger of record**, while Fabrik becomes the AI bookkeeping layer that ingests transactions, proposes classifications, reconciles accounts, detects anomalies, asks the founder questions, and pushes approved journal entries back into the GL.

That dramatically reduces the MVP scope while still letting us deliver a Fondo-like experience.

Below is the PRD I would hand directly to the BA/design/development team. I've deliberately scoped it around having a **credible, working Expo MVP**, rather than building a complete accounting platform.

FABRIK FINANCE

Product Requirements Document — Expo MVP

Version: 1.0
Target Launch: January 2027
Target Event: Land Investment Expo
Initial Market: United States
Primary ICP: Farmers, farm LLCs, agricultural businesses, landowners and land-related SMEs
Product: AI-first financial operations and intelligence platform

---

1. PRODUCT VISION

Fabrik Finance is an AI-first finance platform designed to help agricultural and land-related businesses:

1. Keep and understand their books.
2. Understand their current financial position.
3. Forecast future cash flow.
4. Identify relevant government funding and financing programs.
5. Ask questions about their finances using natural language.
6. Process financial documents using AI.

The long-term vision is:

> **Your AI Finance Department**

For the January 2027 Expo MVP, the primary proposition is:

Know your numbers. Find funding. Make better decisions.

The MVP is not intended to replace QuickBooks.

QuickBooks Online remains the primary accounting system of record. Fabrik Finance provides the AI, intelligence, document processing and workflow layer above it.

---

2. EXPO OBJECTIVE

The MVP must enable a salesperson to demonstrate Fabrik Finance using a realistic US agricultural company within approximately 5–10 minutes.

The demonstration should communicate:

Connect your accounting system → Fabrik understands your business → AI explains your finances → Fabrik forecasts your cash → Fabrik identifies potential funding → you can ask Fabrik financial questions.

The demo should create the perception of a functioning AI finance platform rather than a static prototype.

---

3. TARGET USER

Primary Persona

US farmer / agricultural business owner

Typical profile:

- Farm operated through an LLC or corporation
- $500K$–10M annual revenue
- Uses QuickBooks Online
- Multiple bank accounts
- Equipment purchases/financing
- Seasonal cash flow
- Limited internal finance staff

- Uses external accountant/CPA
- Potentially participates in USDA/FSA or other government programs

Secondary Personas

- Landowners
- Agricultural investors
- Farm management companies
- Agricultural SMEs
- Land-related LLCs
- Rural businesses

---

4. MVP PRODUCT MODULES

The Expo MVP consists of:

Core Modules

1. **Home**
2. **Books**
3. **Documents**
4. **Funding**
5. **CFO**
6. **Ask Fabrik**

Supporting Modules

7. **Bills Lite**
8. **Collect Lite**
9. **Finance Inbox**
10. **Integrations**

Internal Module

11. **Fabrik Operations Portal**

---

5. INFORMATION ARCHITECTURE

Primary navigation:

FABRIK FINANCE

OVERVIEW
Home
Finance Inbox

FINANCE
Books
Bills
Collect

INTELLIGENCE
Funding
CFO
Ask Fabrik

DOCUMENTS
Documents

MANAGE
Integrations
Settings

---

6. HOME DASHBOARD

Objective

Give the business owner an immediate understanding of the financial health of the company.

KPI Cards

Display:

- Cash
- Revenue
- Expenses
- Net Income
- Accounts Receivable
- Upcoming Bills

Example:

SMITH FAMILY FARMS LLC

Cash	$482,000
Revenue YTD	$3,800,000
Expenses YTD	$3,180,000
Net Income	$620,000
Receivables	$310,000
Upcoming Bills	$184,000

Financial Trend

Display:

Revenue vs Expenses

Period filters:

- 3 months
- 6 months
- 12 months
- YTD

AI Finance Brief

Fabrik automatically generates important observations.

Example:

FABRIK FINANCE BRIEF

↑ Revenue increased 8.4% YTD.

⚠ Equipment expenses are 21% higher than last year.

⚠ $82,000 of receivables are more than 30 days old.

✓ Current cash position appears sufficient for the next 13 weeks based on known obligations.

💡 3 potential government funding programs identified.

Each observation should link to the underlying module/data.

---

7. BOOKS

Objective

Provide visibility into accounting transactions while using AI to automate categorization.

QuickBooks Online Integration

OAuth connection with QuickBooks Online.

Import:

- Chart of accounts
- Accounts
- Transactions
- Vendors
- Customers
- Invoices
- Bills
- P&L
- Balance Sheet
- Cash Flow information

Transaction List

Columns:

- Date
- Vendor/Description
- Amount
- Account
- Category
- AI Confidence
- Status

Filters:

- Date
- Account
- Vendor
- Category
- Amount
- Status

AI Categorization

For each transaction Fabrik should determine:

- Normalized vendor
- Transaction type
- Suggested category
- Suggested GL account
- Confidence score
- Potential anomaly
- Possible duplicate
- Document match

Example:

JOHN DEERE

$14,820

Suggested Category:
Equipment / Machinery

Confidence:
97%

Reason:
Similar John Deere transactions have previously
been classified as equipment expenses.

[APPROVE]
[CHANGE]

AI Thresholds

Initial configurable rules:

≥98% — eligible for automatic processing

85–98% — human review

<85% — review or client clarification

Risk rules override confidence.

---

8. FINANCIAL REPORTS

Reports available:

Profit & Loss

Monthly / quarterly / annual.

Balance Sheet

As-of-date reporting.

Cash Flow Statement

Operating / investing / financing.

Reports should primarily use data originating from QuickBooks.

Export:

- PDF
- Excel

---

9. DOCUMENTS / FABRIKIDP

Objective

Use FabrikIDP to understand financial documents and connect them with accounting transactions.

Supported MVP Documents

- Vendor invoices
- Receipts
- Bank statements
- Credit-card statements

Upload

Users can:

- Drag/drop
- Upload PDF
- Upload image

Future versions may support email ingestion.

AI Extraction

Extract where applicable:

- Vendor
- Invoice number
- Invoice date
- Due date

- Amount
- Tax
- Currency
- PO number
- Line items

Transaction Matching

Fabrik should attempt to match documents against QuickBooks transactions.

Example:

JOHN DEERE

Invoice #JD-28712
$14,820

Possible Transaction

JOHN DEERE FINANCIAL
$14,820

Match Confidence: 99%

[MATCH]

---

10. BILLS LITE

Objective

Demonstrate intelligent accounts-payable visibility without implementing payment infrastructure.

Functionality

Bills may originate from:

- QuickBooks

- Document upload

Display:

- Vendor
- Invoice number
- Amount
- Invoice date
- Due date
- Category
- Status

Status

- Received
- Processing
- Needs Review
- Approved
- Paid

Bills Dashboard

Display:

Outstanding	$184,000
Due This Week	$42,000
Overdue	$18,500

Approval

User can:

Approve

Reject

Request Review

No payment execution is included in the Expo MVP.

CFO Integration

Approved/upcoming bills should become inputs into cash-flow forecasting.

---

11. COLLECT LITE

Objective

Give users visibility into accounts receivable and demonstrate AI-assisted collections.

Data

Import invoices and customer information from QuickBooks.

Dashboard

Display:

Outstanding AR	$310,000
Current	$188,000
1–30 Days	$40,000
31–60 Days	$52,000
60+ Days	$30,000

Invoice List

Display:

- Customer
- Invoice #
- Invoice date
- Due date
- Amount
- Outstanding
- Days overdue
- Status

AI Collection Assistant

For overdue invoices Fabrik may recommend:

Send reminder.

User selects:

Generate Reminder

Fabrik generates a professional collection message.

User must approve the communication.

Automated collection workflows are outside the Expo MVP.

---

12. FUNDING

Objective

Identify potentially relevant government funding, financing, assistance and incentive programs based upon the customer's business profile.

This is a hero feature for the Expo MVP.

Funding Categories

Architecture should support:

- Government grants
- USDA programs
- FSA programs
- Farm ownership loans
- Farm operating loans
- Conservation programs
- Disaster assistance
- Rural development programs
- State-level programs

- Tax incentives/credits

The system must distinguish between grants, loans, incentives and assistance programs.

---

13. FARM / BUSINESS PROFILE

Funding matching requires a structured business profile.

Store:

- Legal entity name
- Entity type
- State
- County
- Owners/members
- Ownership percentages
- Revenue
- Expenses
- Assets
- Debt
- Employees
- Farm acreage
- Crops
- Livestock where applicable
- Properties
- Equipment
- Planned investments
- Business activities

Financial fields should be pre-populated from QuickBooks where possible.

Users complete agricultural information manually.

---

14. FUNDING OPPORTUNITY DATABASE

Each opportunity should contain:

- Program name
- Agency
- Program type
- Description
- Geography
- Eligible entities
- Eligible activities
- Financial criteria
- Agricultural criteria
- Funding/loan range where officially specified
- Deadline
- Required documents
- Official source URL
- Last verified date

Funding data should come from authoritative sources wherever practical.

---

15. FUNDING MATCHING ENGINE

Fabrik compares:

Farm/Business Profile

against

Program Eligibility Rules

and produces potential matches.

Each match has:

- Match score
- Match level
- Explanation
- Known qualifying factors
- Missing information
- Potential disqualifiers

- Required documents
- Deadline
- Official source

Match levels:

HIGH POTENTIAL MATCH

POSSIBLE MATCH

MORE INFORMATION REQUIRED

UNLIKELY MATCH

Fabrik must not claim that the business definitely qualifies unless eligibility has actually been confirmed through an appropriate process.

---

16. FUNDING DASHBOARD

Example:

FABRIK FUNDING

Potential Opportunities

6 programs identified

HIGH MATCH 2
POSSIBLE 3
MORE INFORMATION REQUIRED 1

Opportunity detail:

USDA / FSA PROGRAM

MATCH SCORE

87% — HIGH POTENTIAL MATCH

WHY FABRIK IDENTIFIED THIS

✓ Agricultural operation
✓ Geographic criteria match
✓ Entity type appears compatible
✓ Eligible activity detected

INFORMATION REQUIRED

○ Confirm acreage
○ Planned equipment investment

DOCUMENTS AVAILABLE

✓ Profit & Loss
✓ Balance Sheet
✓ Entity information
○ Additional farm information

[CHECK ELIGIBILITY]

---

17. FUNDING APPLICATION READINESS

Fabrik should create an application-readiness checklist.

Example:

APPLICATION READINESS

Financial Statements ✓
Business Information ✓
Entity Information ✓
Ownership Details ✓
Farm Details ✓
Project Description ○
Additional Certification ○

71% READY

The Expo MVP does NOT need to submit applications to government agencies.

---

18. CFO

Objective

Turn accounting information into understandable business intelligence.

CFO Dashboard

Display:

- Cash
- Revenue
- Expenses
- Net income
- Operating margin
- AR
- AP
- 13-week projected cash
- Selected business ratios

AI Insights

Fabrik identifies material financial changes.

Examples:

> Revenue increased 12%.
>
> Equipment expenditure increased 21%.
>
> Accounts receivable over 30 days increased by $42,000.
>
> Fuel expenses are running 14% above the previous period.

Every insight should be grounded in available financial data.

---

19. 13-WEEK CASH-FLOW FORECAST

Inputs

- Current cash
- Expected receivables
- Open invoices
- Upcoming bills
- Recurring expenses
- Historical expenses
- Known obligations

Display expected cash balance by week.

Example:

CURRENT CASH $482K

WEEK 1 $491K
WEEK 2 $462K
WEEK 3 $515K
WEEK 4 $487K
...
WEEK 13 $526K

Users should be able to inspect forecast assumptions.

The forecast must clearly distinguish known amounts from estimated amounts.

---

20. CFO SCENARIOS

Allow users to model basic business decisions.

Examples:

> Purchase $1M farmland with 30% down.
>
> Purchase $250K equipment.

Hire three employees.

Revenue decreases 20%.

Largest customer stops paying.

Scenario output should show changes to:

- Cash
- Expenses
- Debt where applicable
- Profit
- 13-week cash position

The system must display assumptions used in the calculation.

---

21. ASK FABRIK

Objective

Provide a conversational interface across Fabrik Finance.

Ask Fabrik is a hero feature of the Expo demonstration.

The user should not need to know where information is located.

Example questions:

Books

How much did we spend on equipment this year?

Show me payments to John Deere.

Bills

Which bills are due this month?

Collect

Who owes us more than $20,000?

CFO

Why did profit decline last quarter?

Can we afford to purchase another $1M of farmland?

Funding

What government programs might help finance farm expansion?

What programs could potentially help with equipment purchases?

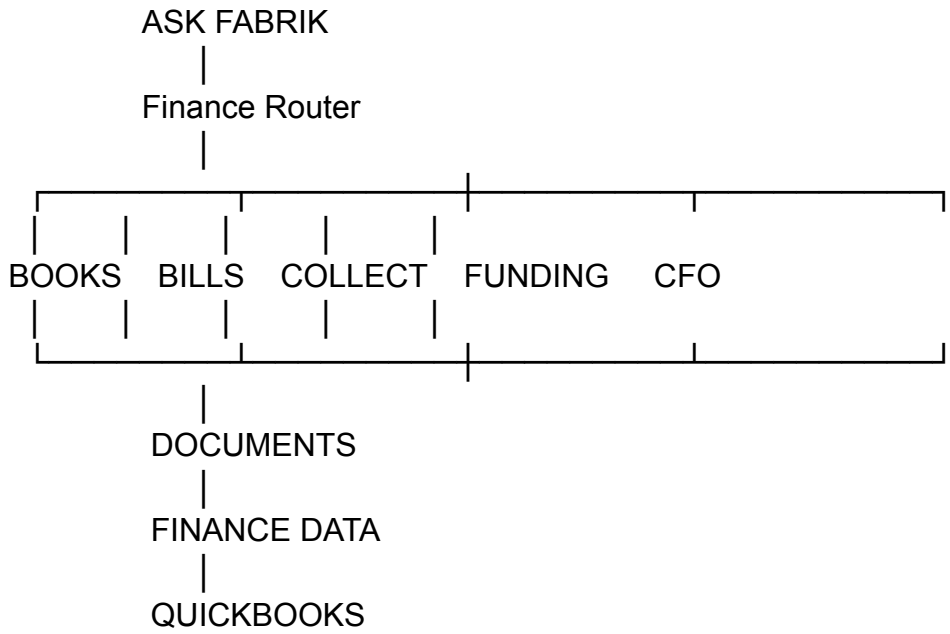

Documents

Show me the invoice for the John Deere purchase.

---

22. ASK FABRIK ARCHITECTURE

Conceptual architecture:

The AI should select the relevant data source/agent automatically.

Responses should be grounded in actual customer data or verified program information.

---

23. FINANCE INBOX

Objective

Give the customer one place for items requiring attention.

Examples:

- Unknown transaction
- Missing document
- Bill approval
- Overdue invoice
- Funding information request
- Bookkeeper question
- Integration issue

Example:

6 ITEMS NEED YOUR ATTENTION

2 Transactions
1 Bill Approval
1 Missing Document
1 Funding Question
1 Overdue Invoice

[REVIEW]

The design principle is:

> Fabrik should interrupt the business owner only when human input or a decision is required.

---

24. FABRIK OPERATIONS PORTAL

Objective

Allow internal bookkeeping staff to manage multiple customers efficiently.

Dashboard:

ACTIVE CLIENTS 25

BOOKS CURRENT 19
NEEDS ATTENTION 4
AT RISK 2

AI PROCESSED 4,821
HUMAN REVIEWED 486

AUTOMATION RATE 90%

Work Queue

Show:

- Client
- Task
- Type
- Priority
- Age
- Assigned user
- Status

AI Review Queue

Operators review low-confidence transactions.

Actions:

Approve

Change

Ask Client

Escalate

Bulk approval should be supported.

---

25. AUDIT TRAIL

Record material AI and human accounting actions.

Store:

- Original value
- AI recommendation
- Confidence
- AI/model version
- User decision
- Change
- User
- Timestamp

This should apply particularly to transaction categorization and document matching.

---

26. SECURITY

MVP requirements:

- Multi-tenant architecture
- RBAC
- MFA support
- TLS
- Encryption at rest
- Secure OAuth token storage
- Tenant isolation
- Audit logging
- Secrets management

- Session management
- Principle of least privilege

No bank/payment credentials should be stored unnecessarily.

---

27. PROPOSED TECHNICAL ARCHITECTURE

Suggested implementation:

Frontend: React / Next.js

Backend: Python / FastAPI

Database: PostgreSQL

Queue/Workers: Redis-based asynchronous processing

Object Storage: AWS S3

Infrastructure: AWS

Accounting Integration: QuickBooks Online API

Document Intelligence: FabrikIDP

AI Layer: Model-agnostic LLM gateway

Authentication: Cognito/Auth0 or equivalent

The architecture should support additional accounting platforms in future without coupling the application directly to QuickBooks-specific data structures.

---

28. DEMO COMPANY

Create a permanent seeded demonstration organization:

Smith Family Farms LLC

Location: Iowa, USA

Business: Corn and soybean farming

Farm Size: 2,400 acres

Revenue: ~$3.8M

Net Income: ~$620K

Cash: ~$482K

Equipment: ~$1.4M

Employees: 8

The demo organization should contain realistic:

- Transactions
- Vendors
- Customers
- Invoices
- Bills
- Financial reports
- Receipts
- Equipment purchases
- Seasonal expenses
- Receivables
- Government-program matches

Demo data must be synthetic.

---

29. EXPO DEMO FLOW

The product should be optimized around this demonstration.

Step 1 — Home

Open Smith Family Farms.

Show:

Cash

Revenue

Profit

Receivables

Bills

AI Finance Brief

Step 2 — Books

Show AI automatically categorizing agricultural transactions.

Example:

John Deere → Equipment

Seed supplier → Crop Inputs

Fuel supplier → Fuel

Step 3 — Document AI

Upload a John Deere invoice.

FabrikIDP extracts it and matches it against a transaction.

Step 4 — CFO

Ask:

> Can we afford to purchase another $1 million of farmland?

Fabrik runs a scenario and explains the financial impact.

Step 5 — Funding

Open Funding.

Show potential USDA/FSA/government programs.

Open a high-potential match and explain why Fabrik identified it.

Step 6 — Ask Fabrik

Ask:

> What government programs could potentially help Smith Family Farms expand?

Then:

> What documents do we already have for these applications?

Fabrik answers using Funding + Books + Documents.

This should be the primary **wow moment** of the Expo demonstration.

---

30. MVP SUCCESS METRICS

Product metrics:

- AI transaction automation rate
- Human review rate
- AI categorization accuracy
- Document extraction accuracy
- Transaction/document match accuracy
- Funding-match quality
- Ask Fabrik answer quality
- QuickBooks synchronization reliability

Operational North Star:

> **Human Minutes per Client per Month**

Initial targets:

Metric	Target
AI transaction automation	>80%
Human transaction review	<20%
Document extraction accuracy	>95%
QBO sync success	>99%
Funding source traceability	100%

---

31. EXPLICITLY OUT OF SCOPE

The following should NOT delay the January Expo MVP:

- Bill payment
- ACH transfers
- Banking
- Corporate cards
- Automated collection execution
- Payment processing
- Payroll execution
- Tax filing
- Government application submission
- Automated grant application submission
- Advanced accounting adjustments
- Inventory accounting
- Multi-currency accounting
- Consolidated accounting
- Native mobile application
- Xero
- NetSuite
- Sage
- Full budgeting platform
- Advanced FP&A

These belong on the post-MVP roadmap.

---

32. MVP PRIORITY

Development priorities should be:

P0 — Must work for Expo

- Home dashboard
- QuickBooks integration
- Books
- AI transaction categorization
- P&L / Balance Sheet / Cash Flow
- FabrikIDP document extraction
- Document matching
- CFO dashboard
- 13-week cash forecast
- Basic scenario modelling
- Funding profile
- Funding database
- Funding matching
- Funding opportunity detail
- Ask Fabrik
- Demo company

P1 — Should work

- Finance Inbox
- Bills Lite
- Collect Lite
- Operations portal
- AI review queue
- Audit trail
- PDF/Excel exports

P2 — Can be simulated/polished after core functionality

- Advanced notifications

- Advanced administration
- Sophisticated approval workflows
- Advanced funding workflows

---

33. PRODUCT POSITIONING

The Expo should NOT primarily position Fabrik Finance as an AI bookkeeping application.

Primary positioning:

Fabrik Finance

AI Finance for Land & Agriculture

Books. Funding. CFO.

Know your numbers. Find funding. Make better decisions.

Supporting proposition:

> Fabrik connects with your accounting data, uses AI to understand your finances, processes financial documents, identifies potential funding opportunities and helps you make better financial decisions.

---

34. MVP DEFINITION OF DONE

The MVP is considered Expo-ready when a salesperson can complete the full Smith Family Farms demonstration without developer assistance and demonstrate:

1. Working financial dashboard.
2. Realistic QuickBooks-derived financial data.
3. AI transaction categorization.
4. FabrikIDP document extraction and matching.

5. Financial reports.
6. Bills/receivables visibility.
7. Working 13-week cash forecast.
8. At least one working CFO scenario.
9. Farm/business profile.
10. Multiple sourced funding opportunities.
11. Explainable funding matching.
12. Application-readiness checklist.
13. Ask Fabrik answering questions across Books, CFO and Funding.
14. Every funding recommendation linked to an authoritative source.
15. Stable seeded Smith Family Farms demo environment.

The overriding product requirement is:

> **The January MVP must tell one coherent story: Fabrik understands the financial position of an agricultural business, keeps its financial information organized, finds potential sources of funding, and turns that information into decisions.**

One thing I would do **before the UI team starts designing screens** is convert this PRD into a **user-story + screen + API/integration matrix**. That will expose which functionality genuinely needs to be built for January versus which can be demonstrated using seeded data, and should materially reduce the MVP development effort.
